

## Case Study

### Hodgson Funeral Home

**Crawford Division:**

Plumbing and HVAC

**Client:**

Hodgson Funeral Home

**Challenge:**

Investigate and resolve cause of flooding basement

**Solution:**

Crawford replaced 2" main water service

**Project Summary:**

Crawford Company received an emergency phone call from Rock Island business, Hodgson Funeral Home. The basement of the building was flooding with water up to 12" and rising. Crawford immediately mobilized equipment and crew to pump the water out of the basement and prevent any further damage. After removing the water it was discovered that the water heater would need to be replaced, but the boiler was still operable.

Upon investigating the cause of the flooding it was determined that the 2" main water service had failed and broken near the foundation of the building. The adjoining parking lot was excavated to access the water line. This work required that the street be barricaded and traffic detoured.

Crawford's Plumbing Division replaced the old water service with a new 2" copper line. The damaged water heater was also replaced.

Crawford's HVAC Division quickly repaired the boiler, returning heat to the building and preventing frozen pipes.
